

Basic Kitura server application

The scaffolded application provides a starting point for creating Swift applications running on Kitura (<http://www.kitura.io/>).

Requirements

- [Swift 4 \(https://swift.org/download/\)](https://swift.org/download/)

Run

Xcode

You can run your project in Xcode by opening the .xcproject file that has been generated for you. Select the target which matches your project name in the upper left hand corner of the window, choose 'My Mac' and click the play button. Your server should now be accessible by going to localhost:8080 in your browser.

Command-line

Run `swift build` in the project's directory, then run `/.build/debug/<your project name>` to start the Kitura server. Your server should now be accessible by going to localhost:8080 in your browser.

Next steps

Visit [kitura.io \(http://www.kitura.io/\)](http://www.kitura.io/) for more information about how you can extend your Kitura server, or try out the Kitura Cloud Ready project.
